Some practice problems for quiz#3

1.
Write a function that receives an integer array and its size and prints the numbers that are divided by both first and last numbers

2.
Write a function that receives two strings containing capital letters only, as arguments and counts how many unique alphabets are present in both strings combined.

3.
Write a function that receives an array of strings as arguments and calculates the sum of ASCII value of all the characters for each string

4.
Write a user defined function that receives one string and beginning address another character array as arguments. The function stores only the vowels from the given string to the character array. The function also returns the number of vowels found in the string

5.
Write a function that receives two integer arrays and their size as arguments and creates a new array by combining the contents of both arrays. The elements of the first array are added first.

6.
Write a function that receives an integer array (containing only single digit integer) and its size as arguments and counts the occurrence of each number.

7.
Write a function that receives a string (containing only uppercase letters) and prints the alphabets that are not present in the string. The missing alphabet should be printed in the dictionary order
