Basics of Operating System

1

SWE 4101
Introduction to Software Engineering

Tanjila Alam Sathi
Lecturer,
Department of CSE,
Islamic University of Technology (IUT)

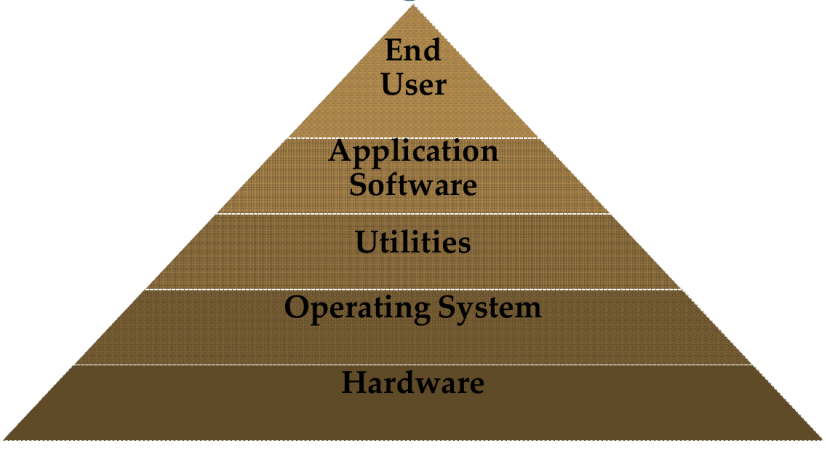

Operating system

2

- Operating system (OS) is system software that controls and coordinates the use of hardware among the different application software and users. OS intermediates between the user of computer and the computer hardware.

Components of Computer System

3

Multiprogramming

7

- Uniprogramming:
  - Only one process is at a time in execution
  - All system resources are exclusively available
- Multiprogramming:
  - Interleaved execution of two or more different and independent programs by a computer.
  - Area occupied by each job residing simultaneously in the main memory is known as a memory partition.

SWE 4101

Process Management

8

- A process is a program in a state of execution.
- It is a unit of work for the operating system.
- A process can be created, executed, and stopped.
- A program is always static and does not have any state.
- A program may have one or more processes running.

SWE 4101

Process State

9

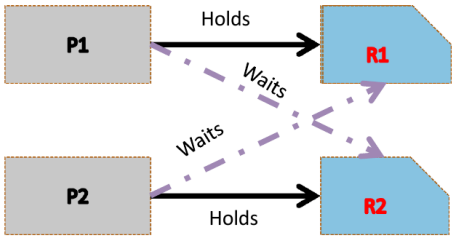

- New—process is in a new state when it is created,
- Ready—process is in ready state when it is waiting for a processor,
- Running—process is in running state if processor is executing the process,
- Waiting—process is in waiting state when it waits for some event to happen (I/O etc), and
- Terminated—process that has finished execution is in terminated state.

SWE 4101

Deadlock

13

- A process waits endlessly for a resource and the requested resource is being used by another process that is waiting for some other resource

SWE 4101

Deadlock

14

- Four necessary Conditions:
  - Mutual Exclusion
  - Non pre-emption
  - Holds and wait
  - Circular wait
- Handling
  - Deadlock Prevention
  - Deadlock Avoidance

SWE 4101

Memory Management

15

- In multiprogramming environment memory management is crucial.
- The single block of available memory is called a hole.
- Hole Allocation Strategy
  - First fit
  - Best fit
  - Worst fit
- ## Causes fragmentation

SWE 4101

Protection And Security

19

- The access of programs, processes, and users, to the resources defined by the computer are controlled by the protection mechanism.
- Security can be ensured using—
- (1) user accounts—individual accounts for each user,
- (2) user authentication—using password protection,
- (3) access rights—define rights for access of different kind of information for different users,
- (4) data encryption—store data in computer in encrypted form, and
- (5) data backup—storing data on a peripheral device other than the hard disk.

SWE 4101

User Interface

20

- Make the computer convenient for use by its user
- Two kinds of interfaces—
  - (1)Command Line Interface (CLI), and
  - (2) Graphical User Interface (GUI).
