PRESENTATION TITLE

CLIMATE CHANGE

Significant changes in the climate that –

- Affect the overall conditions of a region, such as rainfall, temperature, and humidity.
- Lasts for a long time
- Hampers the natural balance of the environment
- Slowly destroys the biodiversity

4

CLIMATE CHANGE

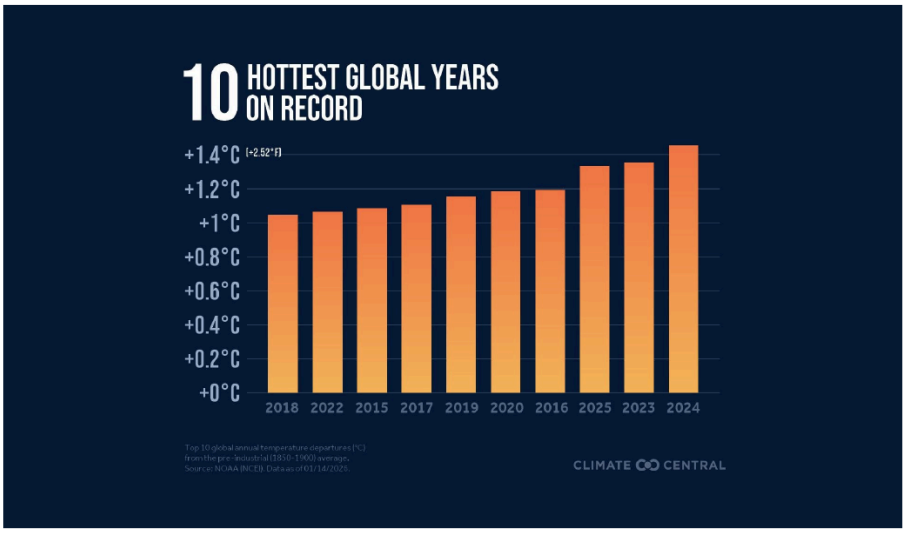

WHAT IS GLOBAL WARMING?

Global Warming is the **long-term heating of the Earth's surface** due to various human activities.

- Sometimes Global Warming and Climate Change are **used interchangeably but they are different**
- Due to climate change, various changes are occurring and one of them is that the Earth's temperature is increasing
- To put it into simple terms, Climate Change is the **cause,** and Global Warming is the **result**

INTERNATIONAL PROTOCOLS ADOPTED FOR GREEN HOUSE GAS EMISSION

The **UNFCCC** (United Nations Framework Convention on Climate Change) is an international environmental **treaty** that states the **goal of the Kyoto Protocol** as the "stabilization of greenhouse gas concentrations in the atmosphere at a level that would prevent dangerous anthropogenic interference with the climate system."

Why did they make the Kyoto Protocol?

Under the Kyoto Protocol, **industrialized nations agreed to cut their greenhouse gas emissions to a certain percentage below 1990 levels.** The year 1990 was chosen as a baseline because that was the year the UN first launched negotiations on climate change.

12

PRESENTATION TITLE

EXAMPLES OF CARBON TRADING

The European Union Emission Trading Scheme (or EU ETS) is the largest multinational greenhouse gas emissions trading scheme in the world. It is one of the EU's central policy instruments to meet its capacity set in the Kyoto Protocol (Jones et al., 2007, p. 64)

Additionally, carbon Trading depends on :

Carbon market

Business-to-business

Regional trade

Country to country

16

PRESENTATION TITLE

ECOLOGICAL FOOTPRINT

An Ecological Footprint is a measure of the amount of bio-productive land and sea required to support a person's lifestyle. It includes the land needed to grow their food, dispose of their waste, and absorb their carbon emissions. The footprint counts all the impacts of personal spending as well as the business and government expenditure on their behalf. The Ecological Footprint shows how carbon emissions compare and interact with other elements of human demand, such as our pressure on food sources, the quantity of living resources required to make the goods we consume, and the amount of land we take out of production when we pave it over to build cities and roads.

Climate change, deforestation, overgrazing, fisheries collapse, food insecurity, and rapid extinction of species are all part of a single, overarching problem: Humanity is simply demanding more from the Earth than it can provide

17

CLIMATE CHANGE

THE SEVE (7) THEORIES OF CLIMATE CHANGE

- IT IS WELL-ESTABLISHED THAT CLIMATE CHANGE IS HAPPENING

SCIENTISTS HAVE PRODUCED 7 THEORIES OF CLIMATE CHANGE THAT COMBINE **NATURAL AND HUMAN-DEPENDENT CAUSES**

LET'S SEE WHAT THEY ARE...

18

CLIMATE CHANGE

22

EMPHASIS ON HUMAN CONTRIBUTION

Some people are quick to point out that climate change is a natural phenomenon. However, this is untrue.

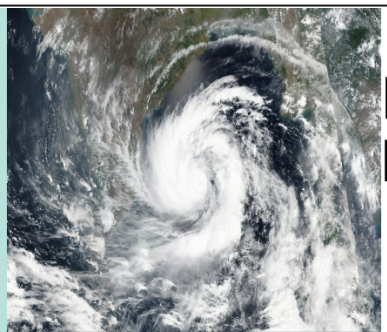

Scientists have considered both causes and have concluded that **without human contribution, modern-era climate change could not have occurred.**

It's time we take responsibility.

"CLIMATE CHANGE ISN'T SOMETHING PEOPLE GET TO CHOOSE TO BELIEVE OR NOT; IT'S HAPPENING."

MATT GAETZ

CLIMATE CHANGE

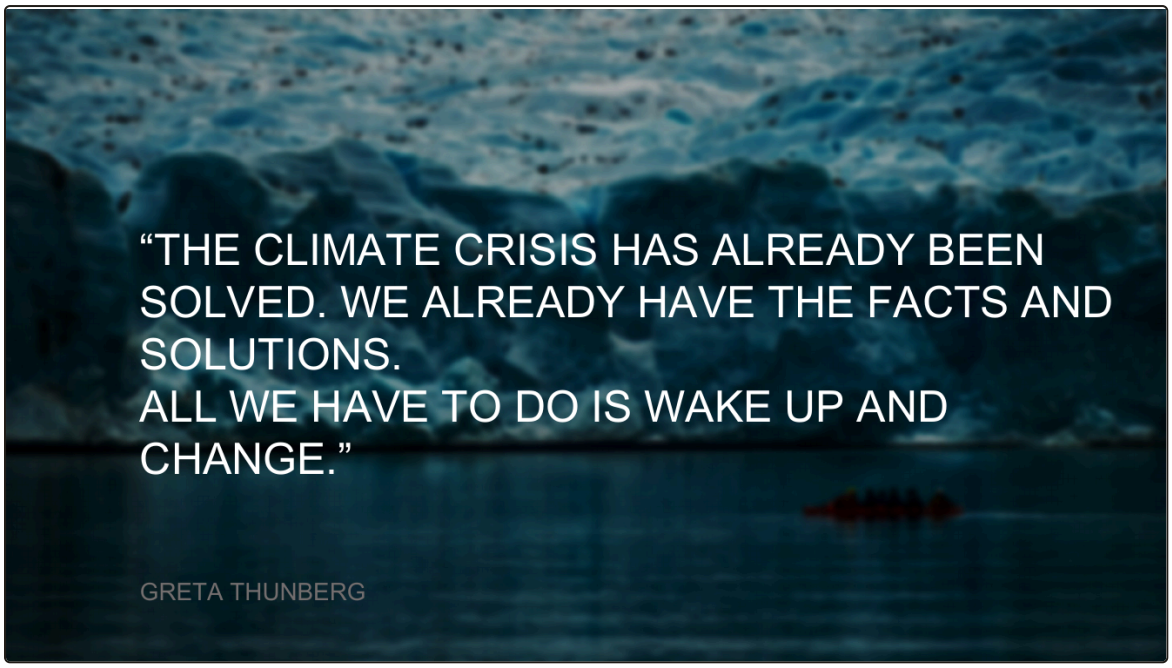

24

IMPACT ON THE ENVIRONMENT

- **Rise in Temperature**
- **Season Shift:** Seasons come and go earlier or later than their expected time
- **Increased and More Extreme Natural Disasters:**
  - Heavy rain causing floods
  - Severe droughts hampering agricultural productions
  - Powerful cyclones and tsunamis destroying lives and property
